Cloud Computing

Erasure Coding (in the Cloud)

Jun Li
Queens College

Large Scale Storage Systems

- Big Data Players: Facebook, Amazon, Google,...

Cluster of machines running Hadoop at Yahoo! (Source: Yahoo!)

- Failures are the **norm**

Node failures at Facebook

XORing Elephants: Novel Erasure Codes for Big Data M. Sathiamoorthy, M. Asteris, D. Papailiopoulos, A. G. Dimakis, R. Vadali, S. Chen, and D. Borthakur, VLDB 2013

Things Fail, Let's Not Lose Data

- Replication
 - Store multiple copies of the data
 - Simple and very commonly used!
 - But, requires a lot of extra storage
- Erasure coding
 - Store extra information we can use to recover the data
 - Fault tolerance with less storage overhead

Erasure Codes, a simple example w/ XOR

A

B

$A \oplus B$

Erasure Codes, a simple example w/ XOR

Erasure Codes, a simple example w/ XOR

A diagram illustrating the XOR relationship used in erasure coding. It shows the equation $A = B \oplus (A \oplus B)$. On the left is a blue box containing the letter 'A'. This is followed by an equals sign. To the right of the equals sign is a blue box containing the letter 'B', followed by a circled plus sign (\oplus), and finally an orange box containing the expression $A \oplus B$.

Reed-Solomon Codes (1960)

- N data blocks
- K coding blocks
- $M = N + K$ total blocks
- Recover any block from any N other blocks!
- Tolerates up to K simultaneous failures
- Works for any N and K (within reason)

Reed-Solomon Code Notation

- N data blocks
- K coding blocks
- $M = N + K$ total blocks
- RS(N,K)
 - (10,4): 10 data blocks, 4 coding blocks
 - f4 uses this, FB HDFS for data warehouse does too
- Will also see [M, N] notation sometimes
 - [14,10]: 14 total blocks, 10 data blocks, (4 coding blocks)

Reed-Solomon Codes, How They Work

- Galois field arithmetic is the secret sauce

	0	1	2	3	4	5	6	7
0	0	1	2	3	4	5	6	7
1	1	0	3	2	5	4	7	6
2	2	3	0	1	6	7	4	5
3	3	2	1	0	7	6	5	4
4	4	5	6	7	0	1	2	3
5	5	4	7	6	1	0	3	2
6	6	7	4	5	2	3	0	1
7	7	6	5	4	3	2	1	0

Addition

	0	1	2	3	4	5	6	7
0	0	0	0	0	0	0	0	0
1	0	1	2	3	4	5	6	7
2	0	2	4	6	3	1	7	5
3	0	3	6	5	7	4	1	2
4	0	4	3	7	6	2	5	1
5	0	5	1	4	2	7	3	6
6	0	6	7	1	5	3	2	4
7	0	7	5	2	1	6	4	3

Multiplication

Encoding

$$\begin{matrix} n \\ \left\{ \begin{array}{c} 1 \\ 0 \\ 0 \\ 0 \\ 0 \\ 1 \\ 5 \end{array} \right\} \end{matrix} \begin{matrix} \begin{bmatrix} 1 & 0 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 1 \\ 1 & 5 & 2 & 7 & 4 \\ 5 & 1 & 3 & 4 & 7 \end{bmatrix} \end{matrix} * \begin{matrix} \begin{bmatrix} D1 \\ D2 \\ D3 \\ D4 \\ D5 \end{bmatrix} \\ \text{Data} \end{matrix} = \begin{matrix} \begin{bmatrix} D1 \\ D2 \\ D3 \\ D4 \\ D5 \\ C1 \\ C2 \end{bmatrix} \\ \text{Data \& Coding} \end{matrix}$$

Distribution Matrix

*Decoding
after D2 and D5 fail*

$$\begin{matrix} \begin{bmatrix} 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 \\ 1 & 5 & 2 & 7 & 4 \\ 5 & 1 & 3 & 4 & 7 \end{bmatrix} \end{matrix}^{-1} * \begin{matrix} \begin{bmatrix} D1 \\ D3 \\ D4 \\ C1 \\ C2 \end{bmatrix} \\ \text{Survivors} \end{matrix} = \begin{matrix} \begin{bmatrix} D1 \\ D2 \\ D3 \\ D4 \\ D5 \end{bmatrix} \\ \text{Data} \end{matrix}$$

Inverted Distribution Matrix

- See “J. S. Plank. A tutorial on Reed-Solomon coding for fault-tolerance in RAID-like systems. *Software—Practice & Experience* 27(9):995–1012, September 1997.”

Reed-Solomon (4,2) Example

A

B

C

D

Reed-Solomon (4,2) Example

Reed-Solomon (4,2) Example

$$A = B + C + D + 1$$

An equation showing the reconstruction of the corrupted block A. On the left is a blue block with the letter 'A'. This is followed by an equals sign. To the right of the equals sign are four terms: a blue block with 'B', a plus sign, a blue block with 'C', a plus sign, a blue block with 'D', a plus sign, and an orange block with the number '1'.

Reed-Solomon (4,2) Example

Erasure Codes Save Storage

- Tolerating 2 failures
 - 3x replication = ____ storage overhead

Erasure Codes Save Storage

- Tolerating 2 failures
 - 3x replication = 3x storage overhead
 - RS(4,2) = ____ storage overhead

Erasure Codes Save Storage

- Tolerating 2 failures
 - 3x replication = 3x storage overhead
 - RS(4,2) = $(4+2)/4 = 1.5x$ storage overhead

Erasure Codes Save Storage

- Tolerating 2 failures
 - 3x replication = 3x storage overhead
 - $RS(4,2) = (4+2)/4 = 1.5x$ storage overhead
- Tolerating 4 failures
 - 5x replication = 5x storage overhead
 - $RS(10,4) = \underline{\hspace{1cm}}$ storage overhead

Erasure Codes Save Storage

- Tolerating 2 failures
 - 3x replication = 3x storage overhead
 - $RS(4,2) = (4+2)/4 = 1.5x$ storage overhead
- Tolerating 4 failures
 - 5x replication = 5x storage overhead
 - $RS(10,4) = (10+4)/10 = 1.4x$ storage overhead
 - $RS(100,4) = \underline{\hspace{1cm}}$ storage overhead

Erasure Codes Save Storage

- Tolerating 2 failures
 - 3x replication = 3x storage overhead
 - $RS(4,2) = (4+2)/4 = 1.5x$ storage overhead
- Tolerating 4 failures
 - 5x replication = 5x storage overhead
 - $RS(10,4) = (10+4)/10 = 1.4x$ storage overhead
 - $RS(100,4) = (100+4)/100 = 1.04x$ storage overhead

What's the Catch?

Catch 1: Encoding Overhead

- Replication:
 - Just copy the data
- Erasure coding:
 - Compute codes over N data blocks for each of the K coding blocks

Catch 2: Decoding Overhead

- Replication
 - Just read the data
- Erasure Coding
 - Normal case is no failures -> just read the data!
 - If there are failures
 - Read N blocks from disks and over the network
 - Compute code over N blocks to reconstruct the failed block

Catch 3: Updating Overhead

- Replication:
 - Update the data in each copy
- Erasure coding
 - Update the data in the data block
 - And all of the coding blocks

Catch 3': Deleting Overhead

- Replication:
 - Delete the data in each copy
- Erasure coding
 - Delete the data in the data block
 - Update all of the coding blocks

Catch 4: Update Consistency

- Replication:
 - Consensus protocol (Paxos!)
- Erasure coding
 - Need to consistently update all coding blocks with a data block
 - Need to consistently apply updates in a total order across all blocks
 - Need to ensure reads, including decoding, are consistent

Catch 5: Fewer Copies for Reading

- Replication
 - Read from any of the copies
- Erasure coding
 - Read from the data block
 - Or reconstruct the data on fly if there is a failure

Catch 6: Larger Min System Size

- Replication
 - Need $K+1$ disjoint places to store data
 - e.g., 3 disks for 3x replication
- Erasure coding
 - Need $M=N+K$ disjoint places to store data
 - e.g., 14 disks for RS(10,4) replication

Different codes make different tradeoffs

- Encoding, decoding, and updating overheads
- Storage overheads
 - Best are “Maximum Distance Separable” or “MDS” codes where K extra blocks allows you to tolerate any K failures
- Configuration options
 - Some allow any (N,K) , some restrict choices of N and K
- See “Erasure Codes for Storage Systems, A Brief Primer. James S. Plank. Usenix ;login: Dec 2013” for a good jumping off point
 - Also a good, accessible resource generally

Let's Improve Our New Hammer!

Erasure Coding Big Picture

- Huge Positive
 - Fault tolerance with less storage overhead!
- Many drawbacks
 - Encoding overhead
 - Decoding overhead
 - Updating overhead
 - Deleting overhead
 - Update consistency
 - Fewer copies for serving reads
 - Larger minimum system size

Erasure Coding Big Picture

- Huge Positive
 - Fault tolerance with less storage overhead!
- Many drawbacks
 - Encoding overhead
 - Decoding overhead
 - ~~Updating overhead~~
 - Deleting overhead
 - ~~Update consistency~~
 - Fewer copies for serving reads
 - Larger minimum system size

Immutable data

Erasure Coding Big Picture

- Huge Positive
 - Fault tolerance with less storage overhead!
- Many drawbacks
 - Encoding overhead
 - Decoding overhead
 - ~~Updating overhead~~
 - Deleting overhead
 - ~~Update consistency~~
 - Fewer copies for serving reads
 - ~~Larger minimum system size~~

Immutable data

Storing lots of data
(when storage overhead
actually matters this is true)

Erasure Coding Big Picture

- Huge Positive
 - Fault tolerance with less storage overhead!
- Many drawbacks
 - Encoding overhead
 - Decoding overhead
 - ~~Updating overhead~~
 - Deleting overhead
 - ~~Update consistency~~
 - Fewer copies for serving reads
 - ~~Larger minimum system size~~

Data is stored for a long time after being written

Immutable data

Storing lots of data
(when storage overhead actually matters this is true)

Erasure Coding Big Picture

- Huge Positive
 - Fault tolerance with less storage overhead!

- Many drawbacks
 - Encoding overhead
 - Decoding overhead
 - ~~Updating overhead~~
 - Deleting overhead
 - ~~Update consistency~~
 - ~~Fewer copies for serving reads~~
 - ~~Larger minimum system size~~

Low read rate

Data is stored for a long time after being written

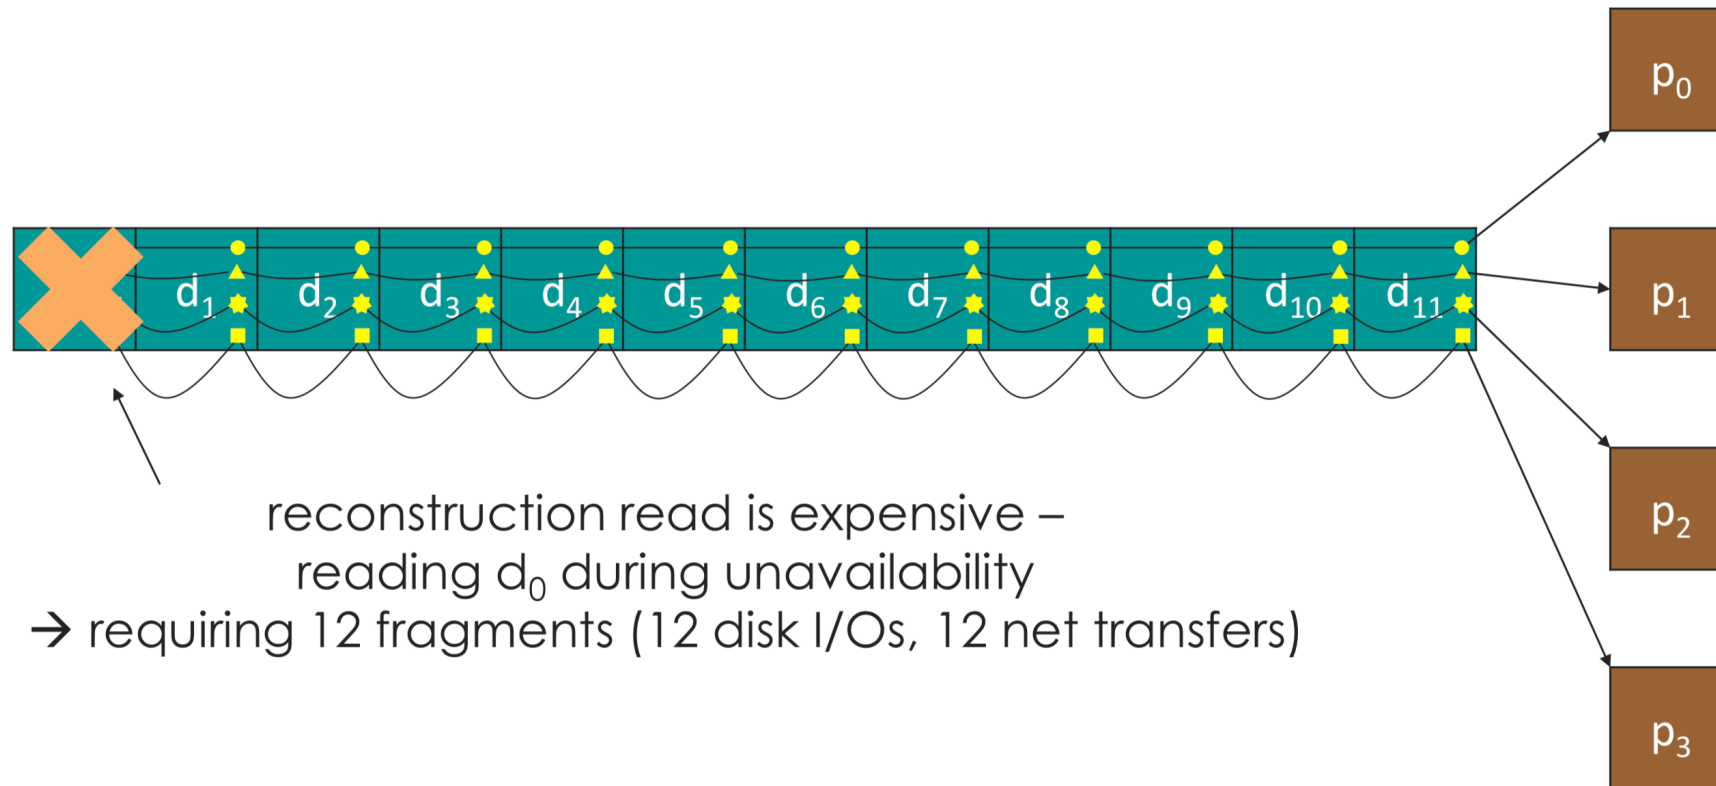

Immutable data

Storing lots of data
(when storage overhead actually matters this is true)

Adoption of EC

- Facebook: f4 stores 65PB of BLOBs in EC
- Windows Azure Storage (WAS)
A PB of new data every 1~2 days - All “sealed” data stored in EC
- Google File System
Large portion of data stored in EC

EC in Windows Azure Storage

Reconstruction - When?

- Load balancing
 - avoid hot storage node -> serve reads via reconstruction
- rolling upgrade of disks
- transient unavailability and performance failures
- Can we achieve 1.33x overhead while requiring only 6 fragments for reconstruction?

Opportunity

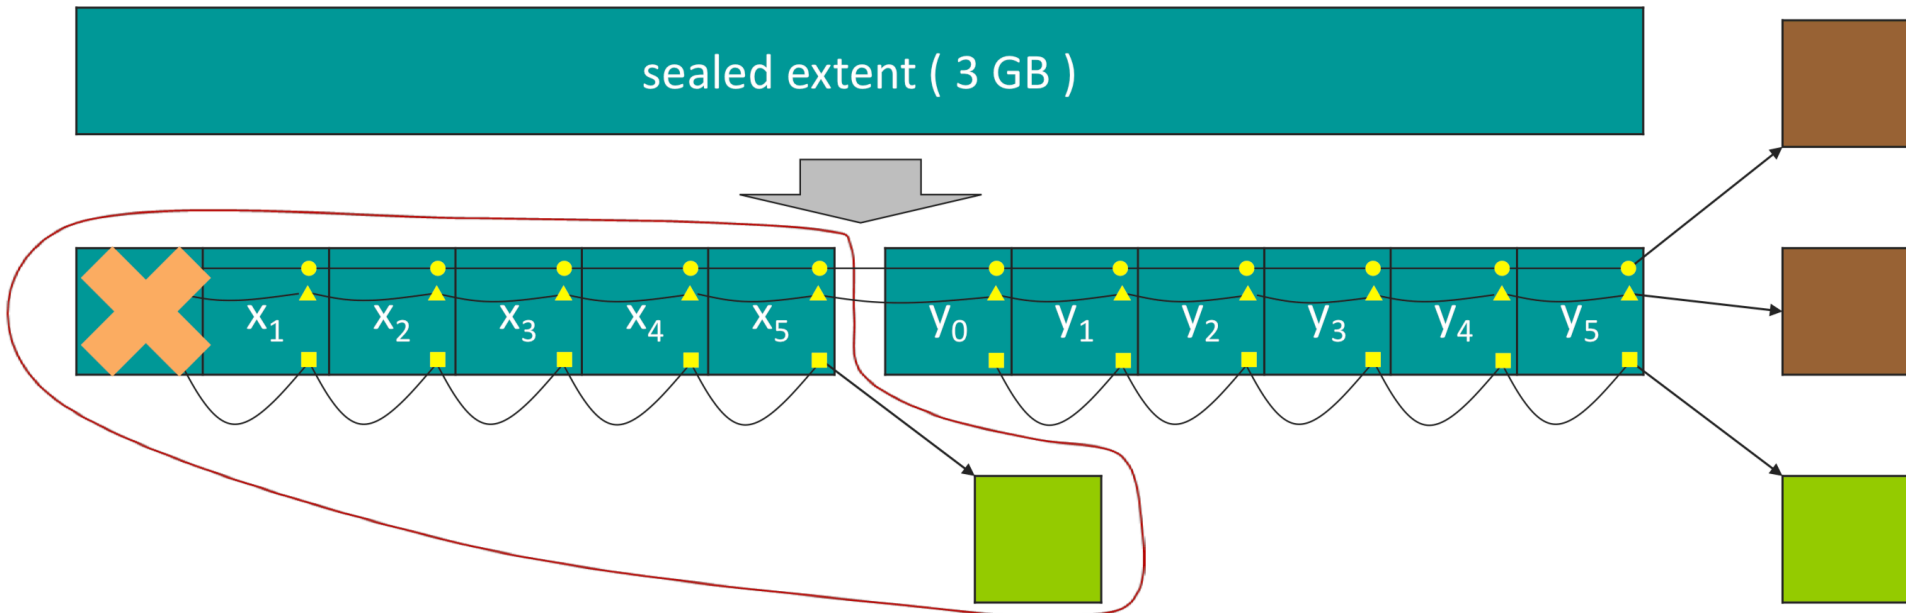

- Conventional EC
 - all failures are equal -> same reconstruction cost, regardless of #failure
 - cloud storage
 - $\text{prob}(1 \text{ failure}) \gg \text{prob}(2 \text{ failures})$

# blocks missing in stripe	% of stripes with missing blocks
1	98.08
2	1.87
3	0.036
4	9×10^{-6}
≥ 5	9×10^{-9}

Opportunity

- Conventional EC
 - all failures are equal -> same reconstruction cost, regardless of #failure
 - cloud storage
 - $\text{prob}(1 \text{ failure}) \gg \text{prob}(2 \text{ failures})$
- Optimize erasure coding for cloud storage
 - making single failure reconstruction most efficient

Local reconstruction code

- LRC₁₂₊₂₊₂: **12** data fragments, **2** local parities and **2** global parities
 - storage overhead: $(12 + 2 + 2) / 12 = 1.33x$
- Local parity: reconstruction requires only 6 fragments

Reconstruct 3 failures

recover y_1 from p_y (group y)

Reconstruct 3 failures

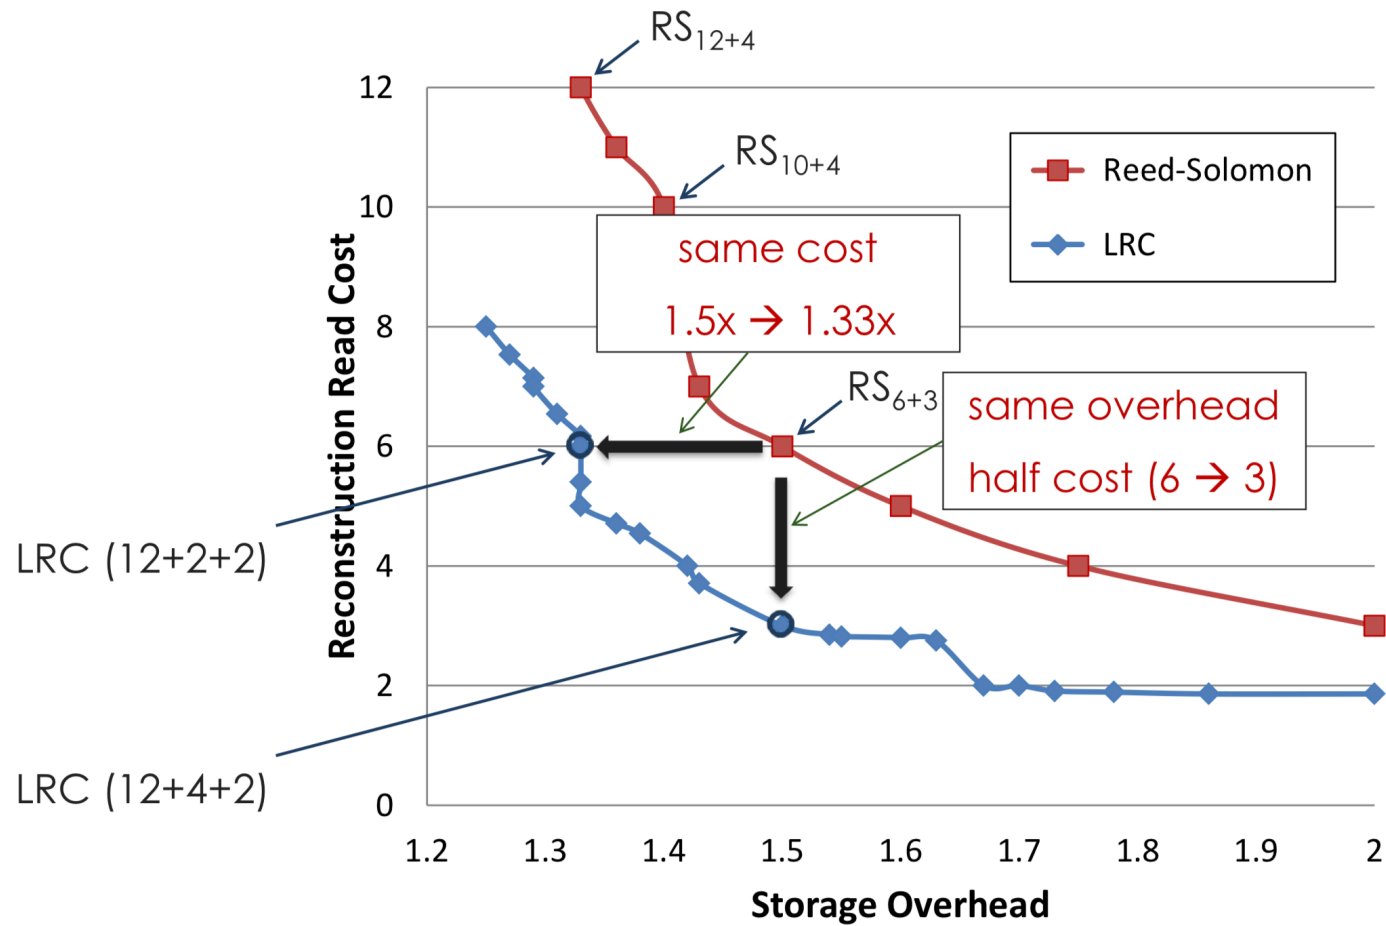

recover y_1 from p_y (group y)
recover x_0 and x_2 from q_0 and q_1

Reconstruct 4 failures

how to recover the 4 failures and all similar cases?

- RS₁₀₊₄: HDFS-RAID at Facebook
- RS₆₊₃: GFS II (Colossus) at Google

Choice of Windows Azure Storage

Properties of LRC

- Reliability
 - LRC_{12+2+2} : arbitrary 3 failures and 86% of 4 failures
 - reliability: $\text{RS}_{12+4} > \text{LRC}_{12+2+2} > \text{RS}_{6+3}$
- Requiring minimum storage overhead given
 - reconstruction cost and fault tolerance
